K.,Chaithra S. T.,2018-12-03 Variability of the Indian summer monsoon has increased significantly since the 1950s For several regions across India this means an increase in long dry periods with low or no rainfall intermittent with short intense spells of rainfall These changes are particularly significant for the western central and eastern states of India where more than 55% of the cultivated area is largely rainfed and where the adaptive capacity is the

lowest The large scale secular changes in monsoon rainfall are attributed to the increase in global emissions of greenhouse gases and air pollutants At the same time local changes through urbanization land use changes and deforestation have brought in a non uniform response in these rainfall trends Changes in the onset duration and intensity of the rainfall call for a reassessment of the crop calendar and climate resilient measures for the food water energy sectors of the country Global warming has also altered the relationship between sea surface temperatures and other predictors of monsoon rainfall introducing increasing challenges and uncertainties in the monsoon forecasts Climate projections indicate a further increase in the monsoon variability and a shortening of the rainy season in the future though there is considerable disagreement between model simulations Modelling Monsoons ,2008 The global monsoon system is so varied and complex that understanding and predicting its diverse behaviour remains a challenge that will occupy modellers for many years to come Despite the difficult task ahead an improved monsoon modelling capability has been realized through the inclusion of more detailed physics of the climate system and higher resolution in our numerical models Perhaps the most crucial improvement to date has been the development of coupled ocean atmosphere models From subseasonal to interdecadal timescales only through the inclusion of air sea interaction can the proper phasing and teleconnections of convection be attained with respect to sea surface temperature variations Even then the response to slow variations in remote forcings e g El Nino Southern Oscillation does not result in a robust solution as there are a host of competing modes of variability that must be represented including those that appear to be chaotic Understanding the links between monsoons and land surface processes is not as mature as that explored regarding air sea interactions A land surface forcing signal appears to dominate the onset of wet season rainfall over the North American monsoon region though the relative role of ocean versus land forcing remains a topic of investigation in all the monsoon systems Also improved forecasts have been made during periods in which additional sounding observations are available for data assimilation Thus there is untapped predictability that can only be attained through the development of a more comprehensive observing system for all monsoon regions Additionally improved parameterizations for example of convection cloud radiation and boundary layer schemes as well as land surface processes are essential to realize the full potential of monsoon predictability Dynamical considerations require ever increased horizontal resolution probably to 0.5 degree or higher in order to resolve many monsoon features including but not limited to the Mei Yu Baiu sudden onset and withdrawal low level jet orientation and variability and orographic forced rainfall Under anthropogenic climate change many competing factors complicate making robust projections of monsoon changes Without aerosol effects increased land sea temperature contrast suggests strengthened monsoon circulation due to climate change However increased aerosol emissions will reflect more solar radiation back to space which may temper or even reduce the strength of monsoon circulations compared to the present day A more comprehensive assessment is needed of the impact of black carbon aerosols which may modulate that of other anthropogenic greenhouse gases Precipitation may behave

independently from the circulation under warming conditions in which an increased atmospheric moisture loading based purely on thermodynamic considerations could result in increased monsoon rainfall under climate change The challenge to improve model parameterizations and include more complex processes and feedbacks pushes computing resources to their limit thus requiring continuous upgrades of computational infrastructure to ensure progress in understanding and predicting the current and future behavior of monsoons

### **Abrupt Monsoon Weakening and Links to Extratropical North**

**Atlantic Cooling** Yuwei Liu, 2014 The monsoon is the most important mode of seasonal climate variation in the tropics responsible for bringing life giving rainfall to the heavily populated regions of East Asia South Asia and West Africa Previous paleoproxy and modeling studies have shown that the North Atlantic can exert considerable influence on the strength of the East Asian South Asian and West African monsoons colder temperatures over the extratropical North Atlantic lead to their weakening This dissertation focuses on understanding the mechanisms of the teleconnection from extratropical North Atlantic sea surface temperature SST to the East Asian South Asian and West African monsoons and the spatiotemporal characteristics of the teleconnection in present and future climate We investigate the atmospheric teleconnection mechanism between extratropical North Atlantic cooling and the West African monsoon weakening in an atmospheric general circulation model GCM focusing on the role of atmospheric temperatures as the mediator We find that the simulated atmospheric cooling readily reaches North Africa and the Sahel and that the cooling in turn weakens the West African monsoon We explicitly show the latter connection by imposing atmospheric cooling anomalies on the northern boundary of a regional climate model of the Sahel it responds with a rainfall reduction over the Sahel that is similar to the GCM In the GCM simulation extratropical North Atlantic cooling is augmented by a positive low cloud feedback and advected downstream cooling Europe and North Africa where the cooling is further amplified by a reduced greenhouse effect from decreased atmospheric specific humidity The results suggest a thermodynamic pathway for the extratropics tropics teleconnection found in paleoclimate studies of the last glacial period We then investigate whether this teleconnection is relevant in monsoonal changes in present day and future climates We focus on the Sahel drought that started during the late 1960 s and persisted until the late 1990 s By analyzing 20th century observations and reanalysis we find a late 1960 s climate shift over Eurasia and Africa characterized by a reduction in summer monsoon rainfall and surface cooling and pressure increases over the Eurasian and North African continental interiors The spatial patterns resemble the simulated impact of extratropical North Atlantic cooling in paleoclimate simulations This late 1960 s climate shift is reproduced in GCM simulations with imposed 20th century observed SST and climate forcing Our analysis of these simulations suggests that the shift originates from an abrupt cooling of extratropical North Atlantic SST over the late 1960 s Idealized GCM simulations with prescribed extratropical North Atlantic cooling also simulate the climate shift The result herein shows that the observed climate signature of the 1960 s abrupt shift in Eurasian and North African climate is consistent with the influence of the abrupt

extratropical North Atlantic cooling that occurred in the late 1960 s Lastly we investigate if the extratropical North Atlantic is relevant for the future monsoon climate evolution through analyzing climate projections of the 21st century from the Coupled Model Intercomparison project phase 5 CMIP5 The dominant pattern of climate change in future projections is global warming there is also an important pattern that is related to the change of extratropical North Atlantic temperature relative to the global mean This pattern features coherent changes in extratropical North Atlantic temperature and Eurasian and North African temperature and precipitation similar to the pattern found for the late 1960 s shift or paleoclimate We show this in two ways first by applying a principle component analysis PCA to the spatial patterns of temperature and rainfall changes at the end of the 21st century across CMIP5 models and second by applying the PCA to the correlation pattern of extratropical North Atlantic temperature with temperature and precipitation for each ensemble member The results suggest that the extratropical North Atlantic teleconnection to the Eurasian and North African monsoons is also relevant in future climate projections As such it suggests for better understanding of the processes controlling extratropical North Atlantic climate in order to constrain estimates of future monsoon activity

**Modeling the Monsoons in a Changing Climate** H. Annamalai, 2011

**Future Projection of Mean and Variability of the Asian Summer Monsoon and Indian Ocean Climate Systems**, 2014 The overall goal of this project is to assess the ability of the CMIP3 5 models to simulate the Indian Ocean monsoon systems The PI along with post docs investigated research issues ranging from synoptic systems to long term trends over the Asian monsoon region The PI applied diagnostic tools such as moist static energy MSE to isolate the moist and radiative processes responsible for extended monsoon breaks over South Asia precursors in the ENSO monsoon association reasons for the drying tendency over South Asia and the possible effect on tropical Indian Ocean climate anomalies influencing certain aspects of ENSO characteristics By diagnosing various observations and coupled model simulations we developed working hypothesis and tested them by carrying out sensitivity experiments with both linear and nonlinear models Possible physical and dynamical reasons for model sensitivities were deduced On the teleconnection front the ability of CMIP5 models in representing the monsoon desert mechanism was examined recently Further more we have applied a suite of diagnostics and have performed an in depth analysis on CMIP5 integrations to isolate the possible reasons for the ENSO monsoon linkage or lack thereof The PI has collaborated with Dr K R Sperber of PCMDI and other CLIVAR Asian Australian monsoon panel members in understanding the ability of CMIP3 5 models in capturing monsoon and its spectrum of variability The objective and process based diagnostics aided in selecting models that best represent the present day monsoon and its variability that are then employed for future projections Two major highlights were an invitation to write a review on present understanding monsoons in a changing climate in Nature Climate Change and identification of an east west shift in observed monsoon rainfall more rainfall over tropical western Pacific and drying tendency over South Asia in the last six decades and attributing that shift to SST rise over the tropical western Pacific On the training of post doctoral

scientists the PI spent considerable amount of time and efforts in introducing the post docs into climate modeling and designing the numerical experiments With training provided and knowledge gained post docs worked in the project obtained long term positions elsewhere The PI also enjoyed the experience in managing the works and educating work ethics to the younger generation Based on the research achievements and publications the PI gave invited talks in major international monsoon conferences workshops and gave lectures in various research organizations in the last six years Finally during the project period the PI attended all the DOE organized PIs meeting and presented the major results Some of the major implications of the project include i Sustained observational efforts are necessary to monitor the three dimensional moisture distribution over the Asian monsoon region that would aid in better understanding modeling and predicting severe monsoons well in advance and ii process based diagnostics lead pathways for model improvements
