

Intermolecular Forces

Intermolecular Forces:

- Forces between molecules
- Responsible for the state of matter: solid, liquid, or gas
- affect the melting and boiling points of compounds as well as the solubility of one substance in another
- weaker than covalent bonds within molecules, since molecular compounds melt easily (melting doesn't break the bond between atoms, but between the molecules themselves!)
 - o example: melting ice to water to steam will break apart the intermolecular forces and change state, but not decompose into H_2 and O_2

Intramolecular Force (Force-Force attraction):

- Forces within molecules
- the attractive force between the valence electrons of one atom and the nucleus of another atom would be considered intermolecular forces
- Covalent bonds are examples of intramolecular forces

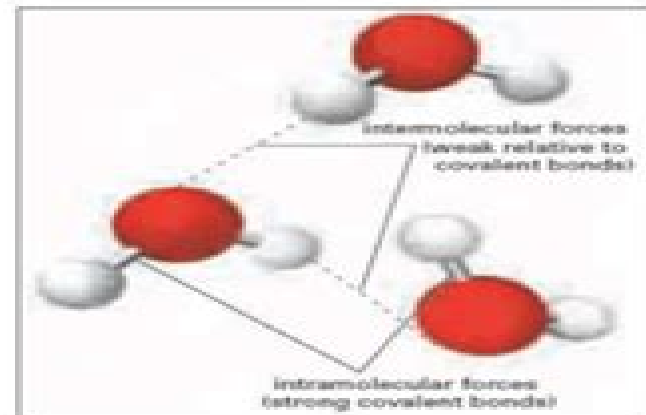

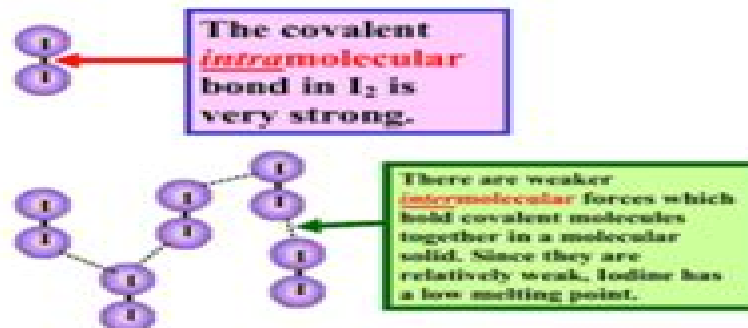

Figure 3.20 Strong intramolecular forces (covalent bonds) hold the atoms in molecules together. Relatively weak intermolecular forces act between molecules.
