Robotics, Vision and Control Peter Corke,Witold Jachimczyk,Remo Pillat,2023-05-15 This textbook provides a comprehensive but tutorial introduction to robotics computer vision and control It is written in a light but informative conversational style weaving text figures mathematics and lines of code into a cohesive narrative Over 1600 code examples show how complex problems can be decomposed and solved using just a few simple lines of code This edition is based on MATLAB and a number of MathWorks toolboxes These provide a set of supported software tools for addressing a broad range of applications in robotics and computer vision These toolboxes enable the reader to easily bring the algorithmic concepts into practice and work with real non trivial problems For the beginning student the book makes the algorithms accessible the toolbox code can be read to gain understanding and the examples illustrate how it can be used The code can also be the starting point for new work for practitioners students or researchers by writing programs based on toolbox functions Two co authors from MathWorks have joined the writing team and bring deep knowledge of these MATLAB toolboxes and workflows

Robotic Sytems With Matlab A. Smith,2017-11-14

Robotics System Toolbox provides algorithms and hardware connectivity for developing autonomous robotics applications for ground vehicles manipulators and humanoid robots Toolbox algorithms include path planning and path following for differential drive robots scan matching obstacle avoidance and state estimation For manipulator robots the system toolbox includes algorithms for inverse kinematics kinematic constraints and dynamics using a rigid body tree representation The system toolbox provides an interface between MATLAB and Simulink and the Robot Operating System ROS that enables you to test and verify applications on ROS enabled robots and robot simulators such as Gazebo It includes examples showing how to work with virtual robots in Gazebo and with actual ROS enabled robots Robotics System Toolbox supports C code generation enabling you to generate a ROS node from a Simulink model and deploy it to a ROS network Support for Simulink External Mode lets you view signals and change parameters while your deployed model is running Robotics System Toolbox uses a fixed set of standards for units to ensure consistency across algorithms and applications Unless specified otherwise functions and classes in this toolbox represent all values in units based on the International System of Units SI In robotics applications many different coordinate systems can be used to define where robots sensors and other objects are located In general the location of an object in 3 D space can be specified by position and orientation values There are multiple posible representations for

these values some of which are specific to certain applications Translation and rotation are alternative terms for position and orientation Robotics System Toolbox supports representations that are commonly used in robotics and allows you to convert between them You can transform between coordinate systems when you apply these representations to 3 D points These supported representations are detailed below with brief explanations of their usage and numeric equivalent in MATLAB Each representation has an abbreviation for its name This is used in the naming of arguments and conversion functions that are supported in this toolbox Setting up a ROS network allows for communication between different devices Different participants or nodes all register with a ROS master to share information The ROS master is unique and each ROS network only has one master Each node is usually a separate device although one device can have multiple nodes running MATLAB acts as one of these nodes when using it to communicate with ROS All devices must be connected to the same actual or virtual network for ROS connections to work You can create a new ROS master in MATLAB or you can connect to an existing ROS master that is running on a different device If you connect to an external master you have to know the IP address or hostname of the device The initial ROS master connection is done by calling `rosinit` Data communication is achieved by sending messages using entities called publishers subscribers and services Publishers send data via topic names which subscribers then receive over the network Services use clients to request information from a server The ROS network is a collection of nodes that are all connected to the ROS master The number of nodes can be quite large depending on your application and devices When nodes get registered with the master communication with all other nodes becomes possible Each node registers different publishers subscribers and services on the ROS master to send and receive information between nodes Even though all nodes in the ROS network are registered with the master data is exchanged directly between nodes

Robotics, Vision and Control Peter Corke, 2011-11-03 The practice of robotics and computer vision both involve the application of computational algorithms to data Over the fairly recent history of the fields of robotics and computer vision a very large body of algorithms has been developed However this body of knowledge is something of a barrier for anybody entering the field or even looking to see if they want to enter the field What is the right algorithm for a particular problem and importantly How can I try it out without spending days coding and debugging it from the original research papers The author has maintained two open source MATLAB Toolboxes for more than 10 years one for robotics and one for vision The key strength of the Toolboxes provide a set of tools that allow the user to work with real problems not trivial examples For the student the book makes the algorithms accessible the Toolbox code can be read to gain understanding and the examples illustrate how it can be used instant gratification in just a couple of lines of MATLAB code The code can also be the starting point for new work for researchers or students by writing programs based on Toolbox functions or modifying the Toolbox code itself The purpose of this book is to expand on the tutorial material provided with the toolboxes add many more examples and to weave this into a narrative that covers robotics and computer vision separately and together The author

shows how complex problems can be decomposed and solved using just a few simple lines of code and hopefully to inspire up and coming researchers The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision It is written in a light but informative style it is easy to read and absorb and includes a lot of Matlab examples and figures The book is a real walk through the fundamentals of robot kinematics dynamics and joint level control then camera models image processing feature extraction and epipolar geometry and bring it all together in a visual servo system Additional material is provided at <http://www.petercorke.com> RVC
