Fading And Interference Mitigation In Wireless Communications:

Fading and Interference Mitigation in Wireless Communications Stefan Panic, Mihajlo Stefanovic, Jelena Anastasov, Petar Spalevic, 2013-12-11 The rapid advancement of various wireless communication system services has created the need to analyze the possibility of their performance improvement. Introducing the basic principles of digital communications performance analysis and its mathematical formalization, *Fading and Interference Mitigation in Wireless Communications* will help you stay up to date with recent developments in the performance analysis of space diversity reception over fading channels in the presence of cochannel interference. The book presents a unified method for computing the performance of digital communication systems characterized by a variety of modulation and detection types and channel models. Explaining the necessary concepts of digital communication system design, the book guides you step by step through the basics of performance analysis of digital communication receivers. Supplying you with the tools to perform an accurate performance evaluation of the proposed communication scenarios, the book includes coverage of multichannel reception in various fading environments, influence of cochannel interference, and macrodiversity reception when channels are simultaneously affected by various types of fading and shadowing. It also includes many numerical illustrations of applications that correspond to practical systems. The book presents a large collection of system performance curves to help researchers and system designers perform their own tradeoff studies. The presented collection of system performances will help you perform trade off studies among the various communication type drawback combinations in order to determine the optimal choice considering the available constraints. The concepts covered in this book can be useful across a range of applications including wireless satellite, terrestrial, and maritime communications.

IEEE Workshop on Signal Processing Advances in Wireless Communications** ,2003 **Channel Estimate-based Performance Prediction for Coherent Linearly Modulated Wireless Communications Systems** Thomas L. Staley,1997 *Cooperative Interference Mitigation in Wireless Cellular Networks* Seyed Arvin Ayoughi,2019 In this thesis we explore potentials of cooperative communication at receivers side in the downlink of wireless cellular networks for interference mitigation and signal enhancement We investigate two regimes of latency and

reliability of communication one for providing high long term average user rates for supporting a quality of service that is suitable for human visual and auditory perception and the other for providing an ultrareliable low latency machine type wireless communication for streaming information in control applications We consider three different models of cooperative communication First we study deploying a multi antenna relay node that provides a nearby cell edge user with extra dimensions over an out of band relaying link We model this scenario by a Gaussian multiple input multiple output MIMO relay channel with correlated noise across relay and destination antennas and analyze the capacity of this channel This type of relay deployment is most effective when the number of receive antennas is small and the number of relay antennas is large enough Second we study deploying a multi antenna half duplex amplify and forward relay node that simultaneously provides multiple cell edge users with extra dimensions We show that the optimized relaying significantly improves the long term average rates of cell edge users even after accounting for the extra bandwidth required for half duplex relaying provided that the relay is equipped with sufficiently many antennas Third we study cooperation among receivers for combating fading and mitigating interference for ultrareliable low latency wireless communication We consider multiple interfering broadcasts from controllers to their corresponding actuators The recently proposed Occupy CoW protocol efficiently exploits the spatial diversity of distributed receivers for combating deep fading It consists of two consecutive phases the broadcast phase and the cooperation phase However it avoids interference by orthogonalization hence its required bandwidth for achieving ultrareliability is not scalable in network size We observe that full frequency reuse in the broadcast phase with successive interference cancellation notably improves the scalability of this protocol We propose two schemes depending on whether interference cancellation or interference avoidance is implemented in the cooperation phase and show that both outperform Occupy CoW each in its own preference region
