Advances in Non-Linear Modeling for Speech Processing Raghunath S. Holambe, Mangesh S. Deshpande, 2012-02-21 Advances in Non Linear Modeling for Speech Processing includes advanced topics in non linear estimation and modeling techniques along with their applications to speaker recognition Non linear aeroacoustic modeling approach is used to estimate the important fine structure speech events which are not revealed by the short time Fourier transform STFT This aeroacoustic modeling approach provides the impetus for the high resolution Teager energy operator TEO This operator is characterized by a time resolution that can track rapid signal energy changes within a glottal cycle The cepstral features like linear prediction cepstral coefficients LPCC and mel frequency cepstral coefficients MFCC are computed from the magnitude spectrum of the speech frame and the phase spectra is neglected To overcome the problem of neglecting the phase spectra the speech production system can be represented as an amplitude modulation frequency modulation AM FM model To demodulate the speech signal to estimation the amplitude envelope and instantaneous frequency components the energy separation algorithm ESA and the Hilbert transform demodulation HTD algorithm are discussed Different features derived using above non linear modeling techniques are used to develop a speaker identification system Finally it is shown that the fusion of speech production and speech perception mechanisms can lead to a robust feature set
