**Positive Systems: Theory and Applications** Luca Benvenuti, Alberto de Santis, Lorenzo Farina, 2003-07-25 The proceedings of the First Multidisciplinary International Symposium on Positive Systems Theory and Applications POSTA 2003 held in Rome Italy August 28 30 2003 Positive Systems are systems in which the relevant variables assume nonnegative values These systems are quite common in applications

where variables represent positive quantities such as populations goods money time data packets flowing in a network densities of chemical species probabilities etc The aim of the symposium was to join together researchers working in the different areas related to positive systems such as telecommunications economy biomedicine chemistry and physics in order to provide a multidisciplinary forum where they have the opportunity to exchange ideas and compare results in a unifying framework

Simulation Conceptual Modeling Jeffrey Strickland, 2011-10-27 Simulation Conceptual Modeling explores several system analysis methods and conceptual modeling techniques It also discusses appropriate tools that may be used to assist with conceptual modeling In addition it discusses how to evaluate the quality of a conceptual model Some commonly used conceptual modeling techniques and methods include Data Flow Modeling Entity Relationship Modeling Event Drive Process Chain Joint Application Development Place Transition Net Modeling State Transition Modeling Object Role Modeling and Unified Modeling Language UML

**Formal Methods in Manufacturing** Javier Campos, Carla Seatzu, Xiaolan Xie, 2018-09-03 Illustrated with real life manufacturing examples Formal Methods in Manufacturing provides state of the art solutions to common problems in manufacturing systems Assuming some knowledge of discrete event systems theory the book first delivers a detailed introduction to the most important formalisms used for the modeling analysis and control of manufacturing systems including Petri nets automata and max plus algebra explaining the advantages of each formal method It then employs the different formalisms to solve specific problems taken from today's industrial world such as modeling and simulation supervisory control including deadlock prevention in a distributed and or decentralized environment performance evaluation including scheduling and optimization fault diagnosis and diagnosability analysis and reconfiguration Containing chapters written by leading experts in their respective fields Formal Methods in Manufacturing helps researchers and application engineers handle fundamental principles and deal with typical quality goals in the design and operation of manufacturing systems

**Analysis of Hybrid Petri Nets with Random Discrete Events** Hamed Ghasemieh, 2017. More and more our society and economy rely on the correct operation of often hidden critical infrastructures. These infrastructures such as the power grid and water and gas distribution networks play an important role in our everyday life. Continuous supply of services from these assets is essential for people organizations and for the security and economy of our society. It is of substantial value to know or estimate how quickly such systems recover to acceptable levels of service after the occurrence of failures natural disasters e.g. fire earthquakes or cyber attacks. Critical infrastructure and naturally hybrid i.e. one needs both discrete and continuous quantities to realistically describe their behaviour. More over in many modern applications there is an intrinsic uncertainty. This is particularly true for dependability analysis of critical infrastructures where one must model the occurrence of failure and repair in a system. In this dissertation we propose the use of an extended version of stochastic hybrid Petri nets. This modelling formalism combines discrete and continuous quantities with random discrete events. Furthermore Petri nets provide a high level and easy to understand formalism. Particularly we consider so called Hybrid Petri nets with General transitions HPnG. The term general transition refers to the arbitrary nature of probability distribution that can be associated with stochastic variables in this model. HPnGs form a restricted subclass of stochastic hybrid models. The arbitrary nature of random discrete events in HPnGs is the main challenge for their analysis. We tackle the analysis of HPnGs by a conditioning argument on the occurrence times of random discrete events. This idea leads to an efficient generation of the underlying state space which provides us with a structure such that measures of interest can be computed exactly and effectively. Unfortunately the exact computation of measures of interests for complex systems.
