Applications Vittorio Bertocci, 2015-12-17 Build advanced authentication solutions for any cloud or web environment Active Directory has been transformed to reflect the cloud revolution modern protocols and today's newest SaaS paradigms This is an authoritative deep dive guide to building Active Directory authentication solutions for these new environments Author Vittorio Bertocci drove these technologies from initial concept to general availability playing key roles in everything from technical design to documentation In this book he delivers comprehensive guidance for building complete solutions For each app type Bertocci presents high level scenarios and quick implementation steps illuminates key concepts in greater depth and helps you refine your solution to improve performance and reliability He helps you make sense of highly abstract architectural diagrams and nitty gritty protocol and implementation details This is the book for people motivated to become experts Active Directory Program Manager Vittorio Bertocci shows you how to Address authentication challenges in the cloud or on premises Systematically protect apps with Azure AD and AD Federation Services Power sign in flows with OpenID Connect Azure AD and AD libraries Make the most of OpenID Connect's middleware and supporting classes Work with the Azure AD representation of apps and their relationships Provide fine grained app access control via roles groups and permissions Consume and expose Web APIs protected by Azure AD Understand new authentication protocols without reading complex spec documents *Active Directory Developer's Reference Library* David Iseminger, 2000 [Programming Windows Identity Foundation](#) Vittorio Bertocci, 2010-09-15 Get hands on guidance designed to help you put the newest .NET Framework component Windows Identity Foundation the identity and access logic for all on premises and cloud development to work *A Guide to Claims-based Identity and Access Control* Dominick Baier, Vittorio Bertocci, Keith Brown, Matias Woloski, Eugenio Pace, 2010 As systems have become interconnected and more complicated programmers needed ways to identify parties across multiple computers One way to do this was for the parties that used applications on one computer to authenticate to the applications and or operating systems that ran on the other computers This mechanism is still widely used for example when logging on to a great number of Web sites However this approach becomes unmanageable when you have many co operating systems as is the case for example in the enterprise Therefore specialized services were invented that would register and authenticate users and subsequently provide claims about them to interested applications Some well known examples are NTLM Kerberos Public Key Infrastructure PKI and the Security Assertion Markup Language SAML Most enterprise applications need some basic user security features At a minimum they need to authenticate their users and many also need to authorize access to certain features so that only privileged users can get to them Some apps must go further and

audit what the user does On Windows these features are built into the operating system and are usually quite easy to integrate into an application By taking advantage of Windows integrated authentication you don't have to invent your own authentication protocol or manage a user database By using access control lists ACLs impersonation and features such as groups you can implement authorization with very little code Indeed this advice applies no matter which OS you are using It's almost always a better idea to integrate closely with the security features in your OS rather than reinventing those features yourself But what happens when you want to extend reach to users who don't happen to have Windows accounts What about users who aren't running Windows at all More and more applications need this type of reach which seems to fly in the face of traditional advice This book gives you enough information to evaluate claims based identity as a possible option when you're planning a new application or making changes to an existing one It is intended for any architect developer or information technology IT professional who designs builds or operates Web applications and services that require identity information about their users
