Explosive pulsed power generators are devices that either convert the chemical energy stored in explosives into electrical energy or use the shock waves generated by explosives to release energy stored in ferroelectric and ferromagnetic materials. The objective of this book is to acquaint the reader with the principles of operation of explosive generators and to provide details on how to design build and test three types of generators flux compression ferroelectric and ferromagnetic generators which are the most developed and the most near term for practical applications. Containing a considerable amount of new experimental data that has been collected by the authors this is the first book that treats all three types of explosive pulsed power generators. In addition there is a brief introduction to a fourth type ix explosive generator called a moving magnet generator. As practical applications for these generators evolve students scientists and engineers will have access to the results of a considerable body of experience gained by almost 10 years of intense research and development by the authors.

**Optoelectronic Properties of Organic Semiconductors** Nasim Zarrabi,2022-02-26 This book focuses on organic semiconductors with particular attention paid to their use as photovoltaic devices. It addresses a fundamental and hitherto overlooked concept in the field of organic optoelectronics namely the role that sub gap states play in the performance of organic semiconducting devices. From a technological point of view organic semiconductor based devices are of significant interest due to their lightweight ease of processability conformal flexibility and potentially low cost and low embodied energy production. Motivated by these rather unique selling points the performance of organic semiconductors has been a subject of multidisciplinary study for more than 60 years with steady progress in applications such as solar cells transistors light emitting diodes and various sensors. The book begins with a review of the main electro optical phenomena in organic solar cells and presents a new method for measuring exciton diffusion lengths based on a low quencher content device structure. Furthermore the book reveals how mid gap trap states are a universal feature in organic semiconductor donor acceptor blends unexpectedly contributing to charge generation and recombination and having profound impact on the thermodynamic limit of organic photovoltaic devices. Featuring cutting edge experimental observations supported with robust and novel theoretical arguments this book delivers important new insight as to the underlying dynamics of exciton generation and diffusion charge transfer state dissociation and indeed the ultimate fate of photogenerated free carriers.
