

Find $y[n]=x[n]*h[n]$ for all integer values of n

Solution

In this problem we will pick $x[n]$ to flip because it is shorter so will be convenient throughout the solution steps.

Step 1: Write both signals $x[n]$ and $h[n]$ as function of i such that: $x[i]$ and $h[i]$

Electrical Science Series A Discrete Time Approach For System Analysis:

The Theory of Linear Systems J. E. Rubio, 2013-10-22 The Theory of Linear Systems presents the state phase analysis of linear systems This book deals with the transform theory of linear systems which had most of its success when applied to time invariant systems Organized into nine chapters this book begins with an overview of the development of some properties of simple differential systems that are mostly of a nonalgebraic nature This text then presents a brief treatment of vector spaces matrices transformations norms and inner products Other chapters deal with the inductive process used to define dynamical systems This book discusses as well the existence and uniqueness theorem for the solutions of a homogeneous linear differential system The final chapter deals with the abstract concept of a dynamical system and derives properties of these systems This book is a valuable resource for advanced graduate students in areas such as economics and bioengineering Engineers engaged in systems design will also find this book useful

Instruction to Statistical Pattern Recognition Keinosuke Fukunaga, 1972-01-01 Introduction to Statistical Pattern Recognition introduces the reader to statistical pattern recognition with emphasis on statistical decision and estimation Pattern recognition problems are discussed in terms of the eigenvalues and eigenvectors Comprised of 11 chapters this book opens with an overview of the formulation of pattern recognition problems The next chapter is devoted to linear algebra with particular reference to the properties of random variables and vectors Hypothesis testing and parameter estimation are then discussed along with error probability estimation and linear classifiers The following chapters focus on successive approaches where the classifier is adaptively adjusted each time one sample is observed feature selection and linear mapping for one distribution and multidistributions and problems of nonlinear mapping The final chapter describes a clustering algorithm and considers criteria for both parametric and nonparametric clustering This monograph will serve as a text for the introductory courses of pattern recognition as well as a reference book for practitioners in the fields of mathematics and statistics

Phase-Locked and Frequency Feedback Systems Jacob Klapper, 2012-12-02 Phase Locked and Frequency Feedback Systems Principles and Techniques presents the operating principles and methods of design of phase locked and frequency feedback systems This book is divided into 10 chapters that provide step by step design procedures and graphical aids with illustrations bearing on real problems experienced in these systems This work specifically tackles the application of these systems as FM demodulators with lowered thresholds Chapters 1 and 2 deal briefly with the elements of linear systems feedback theory and noise providing the minimum background for the material presented in the remainder of the text Chapter 3 describes the characteristics of the major components that comprise the loops and the performance of the conventional and multi loop FM demodulators Chapters 4 to 7 present the basic describing equations and design for the FM feedback FMFB and phase locked loop PLL These chapters further illustrate step by step design procedures with performance characteristics for low threshold angle demodulation using typical design examples Chapter 8 highlights the

design principles which are extended to the design of advanced demodulators featuring demodulation thresholds lower than those of the simple PLL or FMFB Chapter 9 focuses on digital FM demodulation and PLL applications other than FM demodulation Lastly Chapter 10 presents the methods of testing and evaluating loop performance Undergraduate and graduate level students as well as practicing engineers will find this book invaluable

Lumped and Distributed Passive Networks M. Ronald Wohlers, 2013-10-22 *Lumped and Distributed Passive Networks* A Generalized and Advanced Viewpoint considers the mathematical study of a subset of passive linear operators This five chapter focuses on the questions of analysis and representation of such operators and illustrates the results of these analyses by obtaining some of the limitations that are imposed on the performance of passive systems The first two chapters deal with the structure of general linear passive operators These chapters specifically look into the theory of distributions called generalized functions The third and fourth chapters illustrate the application of passive operator theory to rational lumped and irrational distributed systems The fifth chapter discusses some applications of optimization theory to the study of networks

A Discrete-time Approach for System Analysis, 1969 **Transmission Lines With Pulse Excitation** George Metzger, 2012-12-02 *Transmission Lines with Pulse Excitation* aims to provide engineers with a guide to the solution of the problem on the behavior of a pulse signal on a transmission line The book begins with an introduction to the general equations for transmission lines and the simplest pulse the unit step Chapters II and III present the numerical and graphical representation of the methods of traveling waves Chapter IV is devoted to the study of the problem on the propagation of an arbitrary pulse on an arbitrary line The final chapter describes the behavior of a line in the sinusoidal steady state The text will be highly useful to radio engineers and students of engineering

Energy Conversion Statics H. K. Messerle, 2013-10-22 *Energy Conversion Statics* deals with equilibrium situations and processes linking equilibrium states A development of the basic theory of energy conversion statics and its applications is presented In the applications the emphasis is on processes involving electrical energy The text commences by introducing the general concept of energy with a survey of primary and secondary energy forms their availability and use The second chapter presents the basic laws of energy conversion Four postulates defining the overall range of applicability of the general theory are set out demonstrating the basic importance of the stored energy function Subsequent chapters extend the concept of the energy function as a state function introduce transformed functions like coenergy describe the concept of quasi static processes and develop general theorems for one way and cyclic processes The remainder of the text deals with specific fields of energy conversion and the basic theory developed in the first four chapters is used The book is intended for students in the final year of an undergraduate course and it can be used as the basis for graduate courses in energy conversion It may also be used as a basic text for courses in thermodynamics and electromechanics

Subject Catalog Library of Congress, 1982 Applied Automata Theory Julius T. Tou, 2013-10-22 *Applied Automata Theory* provides an engineering style of presentation of some of the applied work in the field of automata

theory Topics covered range from algebraic foundations and recursive functions to regular expressions threshold logic and switching circuits Coding problems and stochastic processes are also discussed along with content addressable memories probabilistic reliability and Turing machines Much emphasis is placed on engineering applications Comprised of nine chapters this book first deals with the algebraic foundations of automata theory focusing on concepts such as semigroups groups and homomorphisms and partially ordered sets and lattices as well as congruences and other relations The reader is then introduced to regular expressions stochastic automata and discrete systems theory and switching networks as models of discrete stochastic processes Subsequent chapters explore applications of automata theory in coding content addressable and distributed logic memories recursive functions and switching circuit theory and synthesis of a cellular computer The book concludes with an assessment of the fundamentals of threshold logic This monograph is intended for graduates or advanced undergraduates taking a course in information science or a course on discrete systems in modern engineering curriculum
