Morphogens in the Wiring of the Nervous System, Juan Pablo Henríquez, Nelson Osses, 2024-04-11. Neuronal function relies on the establishment of proper connections between neurons and their target cells during development. This basic statement involves several cellular processes such as neuronal differentiation, the polarized outgrowth of axons and dendrites from differentiated neurons, and the pathfinding of axons towards target cells. The subsequent recognition of complementary synaptic partners finally triggers the formation, maturation and maintenance of functional synapses. Morphogens are secreted signaling molecules that regulate tissue patterning and cell identity during early embryonic development. Remarkably, growing evidence over the last years arising from different invertebrate and vertebrate model organisms has shown that after cell fate has been established, morphogens also control the precise wiring of the nervous system.
