West Coalinga Field in California Karamay Field and the Qi 40 block in Laohe China *Enhanced Oil Recovery Field Case Studies* Harry L. Chang, 2013-04-10 This chapter covers the alkaline surfactant polymer ASP process and field results Background information describing the history of alkaline alkaline surfactant alkaline polymer and ASP flooding processes is given followed by a review of the requirement of high acid content in the crude oil for these processes to be effective

Enhanced Oil Recovery Field Case Studies Alex Turta, 2013-04-10 This chapter contains a thorough coverage of in situ combustion ISC as an enhanced oil recovery method describing its complex aspects in a simple and practical manner It is the first really international treatise of the subject as the international experience was carefully put together *Enhanced Oil Recovery Field Case Studies* S. Lee, S.I. Kam, 2013-04-10 Based on the enhanced oil recovery EOR survey in Oil and Gas Journal 2010 approximately 280 000bbl of oil per day or 6% of US crude oil production was produced by carbon dioxide CO₂ EOR Just like any other gas injection processes field CO₂ flooding projects suffer from poor sweep efficiency due to early gas breakthrough unfavorable mobility ratio reservoir heterogeneity viscous fingering and channeling and gravity segregation Many of these problems are believed to be alleviated or overcome by foaming the injected CO₂ Since the 1970s CO₂ foam flooding has been used as a commercially viable method for EOR processes Foams defined as a mixture of internal gas phase in a continuous external liquid phase containing surfactant molecules can improve sweep efficiency significantly by reducing gas mobility especially in the reservoirs with a high level of geological heterogeneity This chapter consists of three main parts the first part Section 2 1 deals with fundamentals on foams in porous media and recent advances in this field of research including three foam states weak foam strong foam and intermediate states and two steady state flow regimes of strong foams the second part Section 2 2 overviews field examples of foam assisted CO₂ EOR processes and the third part Section 2 3 covers typical field injection and production responses if CO₂ foam pilot or field scale treatments are successful

Sheng, 2013-04-10 This chapter presents models of wettability alteration using surfactants and upscaling models related to oil recovery in fractured carbonate reservoirs Chemicals used in carbonate reservoirs are reviewed The presented field cases where surfactants were used to stimulate oil recovery are the Maaddud carbonate in Bahrain the Yates field and the Cretaceous Upper Edwards reservoir in Texas the Cottonwood Creek field in Wyoming and the Baturaja formation in the Semoga field in Indonesia **Enhanced Oil Recovery Field Case**

Studies Tor Austad, 2013-04-10 Water flooding of oil reservoirs has been performed for a century in order to improve oil recovery for two reasons 1 give pressure support to the reservoir to prevent gas production and 2 displace the oil by viscous forces During the last 30 years it was discovered that the wetting properties of the reservoir played a very important role for the efficiency of the water flood Even though much work have been published on crude oil brine rock CBR interaction related to wetting properties Professor N R Morrow University of Wyoming asked the audience the following question at the European enhanced oil recovery EOR meeting in Cambridge April 2011 Do we understand water flooding of oil reservoirs If

we are not able to explain why injection fluids of different ionic composition can have a great impact on displacement efficiency and oil recovery the answer to Morrow's question is NO Researchers have to admit that we do not know the phenomena of water flooding well enough The key to improve our understanding is to obtain fundamental chemical understanding of the CBR interaction by controlled laboratory studies and then propose chemical mechanisms which should be validated also from field experience In this chapter I have tried to sum up our experience and chemical understanding on water based EOR in carbonates and sandstones during the last 20 years with a specific focus on initial wetting properties and possibilities for wettability modification to optimize oil recovery Chemically the CBR interaction is completely different in carbonates and sandstones The proposed chemical mechanisms for wettability modification are used to explain field observations

Enhanced Oil Recovery Field Case Studies Lewis Brown, 2013-04-10 Microbial enhanced oil recovery MEOR is the use of microorganisms to increase the recovery of oil from existing oil reservoirs There are nearly 400 US patents dealing with MEOR some of which add microorganisms to nearly depleted oil reservoirs while others rely on the indigenous microorganisms The patent literature is reviewed and two successful field trials by the author are described A completed field trial using microbial permeability profile modification MPPM in a field using waterflooding as the secondary method of oil recovery was proven to recover over 360 000bbl of oil since 2004 and is predicted to recover another 230 000bbl of oil by 2018 A second field trial using MPPM is being employed in a field with a petroliferous formation at 115 C The field is undergoing CO₂ flooding as the secondary recovery method and MPPM has been proven to produce extra oil from five surrounding wells

Enhanced Oil Recovery Field Case Studies James J. Sheng, 2013-04-10 This chapter discusses about these interactions between alkali and surfactant 1 addition of an alkali in a surfactant solution equivalently adds salt 2 addition of an alkali in a surfactant solution changes the surfactant phase behavior and 3 addition of an alkali in a surfactant solution reduces surfactant adsorption After presenting those fundamentals two field pilots are presented Big Sinking field in East Kentucky and White Castle field in Louisiana

Enhanced Oil Recovery Field Case Studies Bernard Tremblay, 2013-04-10 Cold production is a solution gas drive process in which a reservoir saturated with live heavy oil reservoir is depleted as quickly as possible to generate relatively stable gas bubbles leading to higher oil recoveries 5-10% original oil in place OOIP than for light oils 2-5% OOIP More specifically these bubbles increase the oil gas mixture compressibility which maintains the reservoir pressures for longer times than for light oils

Enhanced Oil Recovery Field Case Studies James J. Sheng, 2013-04-10 In this chapter the fundamentals of surfactant flooding are covered
