A Methodology for the Cryptanalysis of Classical Ciphers with Search Metaheuristics George Lasry, 2018 Cryptography the art and science of creating secret codes and cryptanalysis the art and science of breaking secret codes underwent a similar and parallel course during history Both fields evolved from manual encryption methods and manual codebreaking techniques to cipher machines and codebreaking machines in the first half of the 20th century and finally to computerbased encryption and cryptanalysis from the second half of the 20th century However despite the advent of modern computing technology some of the more challenging classical cipher systems and machines have not yet been successfully cryptanalyzed For others cryptanalytic methods exist but only for special and advantageous cases such as when large amounts of ciphertext are available Starting from the 1990s local search metaheuristics such as hill climbing genetic algorithms and simulated annealing have been

employed and in some cases successfully for the cryptanalysis of several classical ciphers. In most cases however results were mixed and the application of such methods rather limited in their scope and performance. In this work a robust framework and methodology for the cryptanalysis of classical ciphers using local search metaheuristics mainly hill climbing and simulated annealing is described. In an extensive set of case studies conducted as part of this research this new methodology has been validated and demonstrated as highly effective for the cryptanalysis of several challenging cipher systems and machines which could not be effectively cryptanalyzed before and with drastic improvements compared to previously published methods. This work also led to the decipherment of original encrypted messages from WWI and to the solution for the first time of several public cryptographic challenges.

Automated Software Testing Elfriede Dustin, Jeff Rashka, John Paul, 1999. A guide to the various tools, techniques and methods available for automated testing of software under development. Using case studies of successful industry implementations the book describes incorporation of automated testing into the development process. In particular the authors focus on the Automated Test Lifecycle Methodology a structured process for designing and executing testing that parallels the Rapid Application Development methodology commonly used.

Relaxation and Decomposition Methods for Mixed Integer Nonlinear Programming Ivo Nowak, 2006-03-28.

Nonlinear optimization problems containing both continuous and discrete variables are called mixed integer nonlinear programs (MINLP). Such problems arise in many fields such as process industry, engineering, design, communications, and finance. There is currently a huge gap between MINLP and mixed integer linear programming (MIP) solver technology. With a modern state of the art MIP solver it is possible to solve models with millions of variables and constraints, whereas the dimension of solvable MINLP is often limited by a number that is smaller by three or four orders of magnitude. It is theoretically possible to approximate a general MINLP by a MIP with arbitrary precision. However, good MIP approximations are usually much larger than the original problem. Moreover, the approximation of nonlinear functions by piecewise linear functions can be difficult and time consuming. In this book relaxation and decomposition methods for solving nonconvex structured MINLPs are proposed. In particular a generic branch and cut and price (BCP) framework for MINLP is presented. BCP is the underlying concept in almost all modern MIP solvers. Providing a powerful decomposition framework for both sequential and parallel solvers it made the success of the current MIP technology possible. So far generic BCP frameworks have been developed only for MIP, for example COIN BCP (IBM, 2003) and ABACUS (OREAS GmbH, 1999). In order to generalize MIP BCP to MINLP BCP the following points have to be taken into account. A given sparse MINLP is reformulated as a block separable program with linear coupling constraints. The block structure makes it possible to generate Lagrangian cuts and to apply Lagrangian

heuristics In order to facilitate the generation of polyhedral relaxations nonlinear convex relaxations are constructed The MINLP separation and pricing subproblems for generating cuts and columns are solved with specialized MINLP solvers
