Applications of Human Performance Models to System Design Grant R. McMillan, David Beevis, Eduardo Salas, 2013-06-29 The human factors profession is currently

attempting to take a more proactive role in the design of man machine systems than has been characteristic of its past. Realizing that human engineering contributions are needed well before the experimental evaluation of prototypes or operational systems, there is a concerted effort to develop tools that predict how humans will interact with proposed designs. This volume provides an overview of one category of such tools: mathematical models of human performance. It represents a collection of invited papers from a 1988 NATO Workshop. The Workshop was conceived and organized by NATO Research Study Group 9 (RSG 9) on Modelling of Human Operator Behaviour in Weapon Systems. It represented the culmination of over five years of effort and was attended by 139 persons from Europe, Canada, and the United States. RSG 9 was established in 1982 by Panel 8 of the Defence Research Group to accomplish the following objectives: Determine the utility and state of the art of human performance modelling; Encourage international research and the exchange of ideas; Foster the practical application of modelling research; Provide a bridge between the models and approaches adopted by engineers and behavioral scientists; Present the findings in an international symposium.

Human Performance and Situation Awareness Measures
Valerie Jane Gawron, 2019-01-04. This book was developed to help researchers and practitioners select measures to be used in the evaluation of human machine systems. The book begins with an overview of the steps involved in developing a test to measure human performance. This is followed by a definition of human performance and a review of human performance measures. Another section defines situational awareness with reviews of situational awareness measures. For both the performance and situational awareness sections, each measure is described along with its strengths and limitations, data requirements, threshold values, and sources of further information. To make this reference easier to use, extensive author and subject indices are provided.

Features: Provides a short engineering tutorial on experimental design; Offers readily accessible information on human performance and situational awareness; SA measures; Presents general description of the measure; Covers data collection, reduction, and analysis requirements; Details the strengths and limitations or restrictions of each measure, including proprietary rights or restrictions.

Attention Arthur F. Kramer, Douglas A. Wiegmann, Alex Kirlik, 2007. The study of attention in the laboratory has been crucial to understanding the mechanisms that support several different facets of attentional processing. Our ability to both divide attention among multiple tasks and stimuli and selectively focus it on task-relevant information while ignoring distracting task-irrelevant information, as well as how top-down and bottom-up factors influence the way that attention is directed within and across modalities. Equally important, however, is research that has attempted to scale up to the real world: this empirical work on attention that has traditionally been well controlled by limited laboratory paradigms and phenomena. These types of basic and theoretically guided applied research on attention have benefited immeasurably from the work of Christopher Wickens. This book honors Wickens' many important contributions to the study of attention by bringing together researchers who examine real-world attentional problems and questions in light of attentional theory. The research fostered by Wickens' contributions will enrich not only our understanding of human

performance in complex real world systems but also reveal the gaps on our knowledge of basic attentional processes
