

10.5 Location of pollen filter

10 Pollen filter renewal

- 1 The pollen filter (where fitted) is located under the engine bulkhead cover panel.
- 2 Refer to Chapter 12 and remove both windscreen wiper arms.
- 3 Unclip the rubber seal from the relevant end of the top of the engine compartment bulkhead.
- 4 Unscrew the retaining fastener screws and pull out the fasteners securing the bulkhead cover panel in position. Release the cover panel from the base of the windscreen and remove it from the vehicle.
- 5 Pivot the pollen filter cover upwards and away then release the retaining clips and withdraw the filter from its housing (see illustration).
- 6 Wipe clean the filter housing then fit the new filter. Clip the filter securely in position and refit the cover.
- 7 Refit the trim cover, securing it in position with the fasteners, and seat the rubber seal on the bulkhead.

11 Idle speed and CO content check and adjustment

- 1 The idle speed is controlled by the ECU via a stepper motor located on the side of the throttle body and is not adjustable.
- 2 The exhaust gas oxygen content is constantly monitored by the ECU via the Lambda sensor, which is mounted in the exhaust downpipe. The ECU then uses this information to modify the injection timing and duration to maintain the optimum air/fuel ratio.

3 Experienced home mechanics with a considerable amount of skill and equipment (including a good-quality tachometer and a good-quality, carefully calibrated exhaust gas analyser) may be able to check the exhaust CO level and the idle speed. However, if these are found to be in need of adjustment, the car must be taken to a suitably-equipped Fiat dealer for testing using the special test equipment which is plugged into the diagnostic connector.

12 Steering and suspension check

Front suspension and steering check

- 1 Raise the front of the vehicle, and securely support it on axle stands (see Jacking and vehicle support).
- 2 Inspect the balljoint dust covers and the steering rack-and-pinion gaiters for splits, chafing or deterioration. Any wear of these will cause loss of lubricant, together with dirt and water entry, resulting in rapid deterioration of the balljoints or steering gear.
- 3 On vehicles with power steering, check the fluid hoses for chafing or deterioration, and the pipe and hose unions for fluid leaks. Also check for signs of fluid leakage under pressure from the steering gear rubber gaiters, which would indicate failed fluid seals within the steering gear.
- 4 Grasp the roadwheel at the 12 o'clock and 6 o'clock positions, and try to rock it (see illustration). Very slight free play may be felt, but if the movement is appreciable, further investigation is necessary to determine the source. Continuous rocking the wheel while an assistant depresses the footbrake. If the movement is now eliminated or significantly reduced, it is likely that the hub bearings are at fault. If the free play is still evident with the footbrake depressed, then there is wear in the suspension joints or mountings.
- 5 Now grasp the wheel at the 9 o'clock and 3 o'clock positions, and try to rock it as before. Any movement felt now may again be caused by wear in the hub bearings or the steering track-rod balljoints. If the inner or outer balljoint is worn, the visual movement will be obvious.

12.4 Rocking a roadwheel to check for wear in the steering/suspension components

- 6 Using a large screwdriver or flat bar, check for wear in the suspension mounting bushes by levering between the relevant suspension component and its attachment point. Some movement is to be expected as the mountings are made of rubber, but excessive wear should be obvious. Also check the condition of any visible rubber bushes, looking for splits, cracks or contamination of the rubber.
- 7 With the car standing on its wheels, have an assistant turn the steering wheel back and forth about an eighth of a turn each way. There should be very little, if any, lost movement between the steering wheel and roadwheels. If this is not the case, closely observe the joints and mountings previously described, but in addition, check the steering column universal joints for wear, and the rack-and-pinion steering gear itself.

Suspension strut/shock absorber check

- 8 Check for any signs of fluid leakage around the suspension strut/shock absorber body, or from the rubber gaiter around the piston rod. Should any fluid be noticed, the suspension strut/shock absorber is defective internally, and should be renewed. **Note:** Suspension struts/shock absorbers should always be renewed in pairs on the same axle.
- 9 The efficiency of the suspension strut/shock absorber may be checked by bouncing the vehicle at each corner. Generally speaking, the body will return to its normal position and stop after being depressed. If it rises and returns on a rebound, the suspension strut/shock absorber is probably suspect. Examine also the suspension strut/shock absorber upper and lower mountings for any signs of wear.

13 Auxiliary drivebelt(s) check and renewal

Note: Fiat specify the use of a special tool to correctly set the drivebelt tension. If access to this equipment cannot be obtained, an

approximate setting can be achieved using the method described below. If the method described is used, the tension should be checked using the special tool at the earliest possible opportunity.

- 1 Depending on equipment fitted, one, two or three auxiliary drivebelts may be fitted. The alternator, power steering pump and air

conditioning compressor, as applicable, are each driven by an individual drivebelt.

Checking

- 2 Disconnect the battery negative terminal (refer to Disconnecting the battery in the Reference Section of this manual).
- 3 Firmly apply the handbrake, then jack up
