

Part I – Recrystallization of Benzoic Acid

A student was tasked with purification of an impure (i.e., crude) sample of benzoic acid and assessment of the success of purification via melting point analysis. The student obtained a vial labeled "U6R" and prepared two capillary tubes with the crude benzoic acid sample. Thereafter, the student weighed the remaining crude sample, recording a mass of 1.032 g. The student purified the sample via recrystallization, and observed that sand had been visibly left behind in the flask upon decanting the dissolved solution of benzoic acid and urea. Upon gradual cooling, sharp, needle-like white crystals began to form within the beaker containing the solution. Once the beaker reached room temperature, it was chilled for several more minutes in an ice bath before the student proceeded to collect the crystals via filtration. After collecting and drying the crystals, the student weighed them and recorded a mass of 0.766 g. Having completed the purification, the student prepared to perform melting point analysis in order to evaluate the purity of the recovered crystals.

Part II – Determination of Melting Points

The student ground and then prepared a representative sample of the recrystallized benzoic acid in a capillary tube. Analyzing the recrystallized sample and the crude sample with a Mel-Temp apparatus, the student noted that the crude sample had a melting point range of 91.3 °C – 112.7 °C and the recrystallized sample had a melting point range of 118.3 °C – 119.5 °C.

Part III – Mixed Melting Point Analysis

In addition to the task of purifying the impure benzoic acid standard, the student was also tasked with identifying benzoic acid from a collection of three unknown compounds. Notably, these compounds were each found to melt within a few degrees of the known melting point range of benzoic acid, and could not be eliminated as suspects based on their pure melting point range or appearance.

While the Mel-Temp apparatus was cooling following the first round of analysis, the student ground a small sample of a pure benzoic acid standard. The student then prepared a capillary tube using a portion of the standard sample. Additionally, the student collected a very small quantity of each of the three different unknowns, placing them in separately labeled fraction vials. To each of these vials, the student proceeded to add an equivalent amount of standard benzoic acid, creating three unknown mixtures. Grinding each mixture, the student prepared one capillary tube for each unknown mixture.

The student then analyzed the benzoic acid standard alongside the first unknown mixture, corresponding to the unknown that was labeled as "J." The student noted that the standard had a melting point range of 119.6 – 120.2 °C and that the mixture containing unknown J had a melting point range of 106.0 – 119.4 °C. After allowing time to cool, the student further analyzed the second unknown mixture, corresponding to the unknown that was labeled as "Φ," alongside the third unknown mixture, corresponding to the unknown that was labeled as "ψ." The mixture containing unknown Φ was found to have a melting point range of 94.8 – 111.2 °C and the mixture containing ψ was found to have a melting point range of 117.9 – 119.1 °C.
