**A Visual Astronomer's Photographic Guide to the Deep Sky** Stefan Rumistrzewicz, 2010-11-01 Over the last 15 years or so there has been a huge increase in the popularity of astrophotography with the advent of digital SLR cameras and CCD imagers These have enabled astronomers to take many images and indeed check images as they scan the skies Processing techniques using computer software have also made developing these images

more accessible to those of us who are chemically challenged And let's face it some of the pictures you see these days in magazines books and on popular web forums are frankly amazing So why bother looking through the eyepiece you ask Well for one thing setting up the equipment is quicker You just take your scope out of the garage or if you're lucky enough to own one open the roof of your observatory align the scope and off you go If you have an equatorial mount you'll still need to roughly polar align but this really takes only a few moments The imager would most likely need to spend more time setting up This would include very accurate polar alignment for equatorial mounts then finding a guide star using his or her finder checking the software is functioning properly and continuous monitoring to make sure the alignment is absolutely precise throughout the imaging run That said an imager with a snug obsy at the end of the garden will have a quicker time setting up but then again so will the visual observer

**Deep-Sky Companions: The Secret Deep** Stephen James O'Meara, 2011-06-30 In this fresh list Stephen James O'Meara presents 109 new objects for stargazers to observe. The Secret Deep list contains many exceptional objects including a planetary nebula whose last thermal pulse produced a circumstellar shell similar to the one expected in the final days of our Sun's life, a piece of the only supernova remnant known visible to the unaided eye, the flattest galaxy known, the largest edge-on galaxy in the heavens, the brightest quasar, and the companion star to one of the first black hole candidates ever discovered. Each object is accompanied by beautiful photographs and sketches, original finder charts, visual histories, and up-to-date astrophysical information to enrich the observing experience. Featuring galaxies, clusters, and nebulae not covered in other Deep Sky Companions books, this is a wonderful addition to the series and an essential guide for any deep sky observer.

**Planetary Nebulae and How to Observe Them** Martin Griffiths, 2012-03 This book is for amateur astronomers who want to go beyond the Messier objects, concentrating on one of the most beautiful classes of astronomical object. It describes over 100 nebulae personally observed by the author using telescopes of various sizes.

[Star Maps](#) Nick Kanas, 2012-06-05 Until the publication of the first edition of Star Maps, books were either general histories of astronomy using examples of antiquarian celestial maps as illustrations or catalogs of celestial atlases that failed to trace the flow of sky map development over time. The second edition focuses on the development of contemporary views of the heavens and advances in map making. It captures the beauty and awe of the heavens through images from antiquarian celestial prints and star atlases. This book uniquely combines a number of features: 1 the history of celestial cartography is traced from ancient to modern times; 2 this development is integrated with contemporary cosmological systems; 3 the artistry of sky maps is shown using beautiful color images from actual celestial atlases and prints; 4 each illustration is accompanied by a legend explaining what is being shown; and 5 the text is written for the lay reader based on the author's experience with writing articles for amateur astronomy and map collector magazines. This updated second edition of Star Maps contains over 50 new pages of text and 44 new images, 16 in color, including completely new sections on celestial frontispieces, deep sky objects, playing card maps, additional cartographers, and modern computerized star maps. There is also expanded material about celestial globes, volvelles, telescopes, and planets and asteroids.
