Fungi Endophytic Identification Guide:

Phoma: Diversity, Taxonomy, Bioactivities, and Nanotechnology Mahendra Rai, Beata Zimowska, György János Kövics, 2021-11-19 The book covers the taxonomy diversity bioactivity and nanotechnology involved in the study of the genus Phoma. It presents the most recent molecular taxonomic approach, secondary metabolites, different bioactivities, combating microbial threats, and its use in nanotechnology from a basic research to an applied perspective. Expert contributors provide the latest research and applications to present thorough coverage of this important genus in human and plant pathology and the disease management. Plant Microbiome Engineering Dhanasekaran Dharumadurai, A. Sankara Narayanan, 2024-12-11

This volume provides lab-oriented protocols to deal with the various plant microbiome engineering approaches in a lucid and simple manner. Chapters are divided into four sections detailing plant-associated microbiomes, single-cell genomics, whole community metagenomics, metabolic network monitoring, and advanced methods in plant microbiome engineering. Written in the format of the Methods and Protocols in Food Science series, the chapters include an introduction to the respective topic, list necessary materials and reagents, detail well-established and validated methods for readily reproducible laboratory protocols, and contain notes on how to avoid or solve typical problems. Authoritative and cutting-edge Plant Microbiome Engineering aims to provide well-established protocols and procedures largely used by both academics and industries.

Molecular Taxonomy of Ascomycetes and Basidiomycetes: Unveiling Fungal Diversity and Evolution Sinang Hongsan, Ahmed M. Abdel-Azeem, Steven Miller, 2025-11-24 Accurate identification and classification of fungi in Ascomycetes and Basidiomycetes are crucial due to their significant roles in ecosystems ranging from organic matter decomposition to symbiotic relationships with plants. Additionally, some fungi can cause diseases; thus, it is important to provide accurate identification to contribute to developing innovative solutions safeguarding human health and agricultural systems. However, Ascomycetes and Basidiomycetes show considerable diversity in appearance, behavior, and ecological roles, posing challenges for traditional morphology-based identification, especially when dealing with cryptic or morphologically similar species. This misclassification hinders our understanding of fungal diversity and blocks progress in various fields. Molecular techniques utilizing DNA sequences as unique identifiers offer a promising solution, enabling differentiation of closely related fungal species often indistinguishable through microscopy. These molecular approaches not only reveal hidden diversity but also facilitate the exploration of intricate evolutionary relationships within fungal groups. Despite previous research, many questions regarding fungal species relationships, adaptations, and evolution remain unanswered. Hence, it is crucial to continue discovering new fungal species, resolving ambiguities within specific fungal groups, and studying their interactions with other organisms. This research topic aims to advance the use of molecular techniques for the taxonomy of Ascomycetes and Basidiomycetes. By leveraging DNA sequencing and other molecular tools, the goal is to address specific questions related to fungal diversity, evolutionary relationships, and species identification. The research will test hypotheses

concerning the genetic diversity and phylogenetic relationships within these fungal groups aiming to uncover new species and clarify existing taxonomic ambiguities To gather further insights into the molecular taxonomy of Ascomycetes and Basidiomycetes we welcome effective review and original research articles addressing but not limited to the following themes Molecular identification and classification of fungal species Phylogenetic studies revealing evolutionary relationships Discovery and description of new fungal taxa Genetic diversity and population structure analyses Ecological roles and interactions of fungi with other organisms Advances in molecular techniques and methodologies for fungal taxonomy Revisions and updates to fungal nomenclature and classification systems

(Diaporthales) and Its Phaeoacremonium Anamorphs L. E. Mostert,2006 The genus Togninia Diaporthales Togniniaceae is here monographed along with its Phaeoacremonium Pm anamorphs Ten species of Togninia and 22 species of Phaeoacremonium are treated Several new species of Togninia T are described namely T argentinensis anamorph Pm argentinense T austroafricana anamorph Pm austroafricanum T krajdenii T parasitica T rubrigena and T viticola New species of Phaeoacremonium include Pm novae zealandiae teleomorph T novae zealandiae Pm iraniamum Pm sphinctrophorum and Pm theobromatis Species can be identified based on their cultural and morphological characters supported by DNA data derived from partial sequences of the actin and tubulin genes Phylogenies of the SSU and LSU rRNA genes were used to determine whether Togninia has more affinity with the Calosphaeriales or the Diaporthales The results confirmed that Togninia had a higher affinity to the Diaporthales than the Calosphaeriales Examination of type specimens revealed that T cornicola T vasculosa T rhododendri T minima var timidula and T villosa were not members of Togninia The new combinations Calosphaeria cornicola Calosphaeria rhododendri Calosphaeria transversa Calosphaeria tumidula Calosphaeria vasculosa and Jattaia villosa are proposed Species of Phaeoacremonium are known vascular plant pathogens causing wilting and dieback of woody plants The most prominent diseases in which they are involved are Petri disease and esca which occur on grapevines and are caused by a complex of fungi often including multiple species of Phaeoacremonium Various Phaeoacremonium species are opportunistic fungi on humans and cause phaeohyphomycosis The correct and rapid identification of Phaeoacremonium species is important to facilitate the understanding of their involvement in plant as well as human disease A rapid identification method was developed for the 22 species of Phaeoacremonium It involved the use of 23

species specific primers including 20 primers targeting the tubulin gene and three targeting the actin gene These primers can be used in 14 multiplex reactions Additionally a multiple entry electronic key based on morphological cultural and tubulin sequence data was developed to facilitate phenotypic and sequence based species identification of the different Phaeoacremonium species Separate dichotomous keys are provided for the identification of the Togninia and Phaeoacremonium species Keys for the identification of Phaeoacremonium like fungi and the genera related to Togninia are also provided The mating strategy of several Togninia species was investigated with ascospores obtained from fertile perithecia produced in vitro Togninia argentinensis and T novae zealandiae have homothallic mating systems whereas T austroafricana T krajdenii T minima T parasitica T rubrigena and T viticola were heterothallic *Canadian Journal of Botany*, 2001
