This volume contains lecture notes of the 14th Reasoning Web Summer School RW 2018 held in Esch sur Alzette Luxembourg in September 2018 The research areas of Semantic Web Linked Data and Knowledge Graphs have recently received a lot of attention in academia and industry Since its inception in 2001 the Semantic Web has aimed at enriching the existing Web with meta data and processing methods so as to provide Web based systems with intelligent capabilities such as context awareness and decision support The Semantic Web vision has been driving many community efforts which have invested a lot of resources in developing vocabularies and ontologies for annotating their resources semantically Besides ontologies rules have long been a central part of the Semantic Web framework and are available as one of its fundamental representation tools with logic serving as a unifying foundation Linked Data is a related research area which studies how one can makeRDF data available on the Web and interconnect it with other data with the aim of increasing its value for everybody Knowledge Graphs have been shown useful not only for Web search as demonstrated by Google Bing etc but also in many application domains

Study on Data Placement Strategies in Distributed RDF Stores Daniel Dominik

Janke,2020-03-15 The distributed setting of RDF stores in the cloud poses many challenges including how to optimize data placement on the compute nodes to improve query performance In this book a novel benchmarking methodology is developed for data placement strategies one that overcomes these limitations by using a data placement strategy independent distributed RDF store to analyze the effect of the data placement strategies on query performance Frequently used data placement strategies have been evaluated and this evaluation challenges the commonly held belief that data placement strategies which emphasize local computation lead to faster query executions Indeed results indicate that queries with a high workload can be executed faster on hash based data placement strategies than on for example minimal edge cut covers The analysis of additional measurements indicates that vertical parallelization i e a well distributed workload may be more important than horizontal containment i e minimal data transport for efficient query processing Two such data placement

strategies are proposed the first found in the literature is entitled overpartitioned minimal edge cut cover and the second is the newly developed molecule hash cover Evaluation revealed a balanced query workload and a high horizontal containment which lead to a high vertical parallelization As a result these strategies demonstrated better query performance than other frequently used data placement strategies The book also tests the hypothesis that collocating small connected triple sets on the same compute node while balancing the amount of triples stored on the different compute nodes leads to a high vertical parallelization
